PROFESSIONAL SUMMARY

Detail-oriented and highly motivated Computer Science student (3rd Year) specializing in Backend Software Engineering within the .NET ecosystem. Competent in designing scalable RESTful APIs, relational database architecture, and implementing secure authentication mechanisms (JWT, RBAC). Proven capability in driving full-cycle development from scratch to production deployment, optimizing backend services for performance and data consistency.

TECHNICAL SKILLS

Backend Stack:	C#, .NET Core, ASP.NET Web API, RESTful APIs, ADO.NET
Data & ORM:	Microsoft SQL Server, Entity Framework Core, Relational Database Design, Azure SQL (Basic)
Security & Tools:	JWT Authentication, Role-Based Access Control (RBAC), HTTPS, Git/GitHub, Visual Studio
Desktop / Other:	WPF, Windows Forms (WinForms) for admin integrations, Object-Oriented Programming (OOP), C++
Languages:	Arabic (Native), English (Upper-Intermediate / B2 Level)

KEY PROJECTS (BACKEND FOCUS)

Venice Sweets App | Production Deployment

Technologies: C#, ASP.NET Core Web API, EF Core, SQL Server, Razor Pages, Server-side Caching

- Designed and developed a robust, production-ready backend architecture from scratch to handle remote administration dashboards.
- Engineered RESTful endpoints enabling authenticated owners to manage products, categories, users, and real-time sales metrics without disrupting physical POS hardware.
- Optimized high-resolution data payloads by implementing backend compression algorithms and caching mechanisms, reducing server-response and rendering lag by over 60%.
- Enforced isolated corporate security constraints by deploying the architecture purely via secure internal network configurations.

MedStock Hospital Inventory & Management System | Under Development

Technologies: C#, .NET Core Web API, SQL Server, JWT, HTTPS, Role-Based Access Control (RBAC), WPF

- Architected an enterprise-level backend service to transition critical medical resource inventory and employee lifecycles from paper-based tracking to fully secure relational databases.
- Secured critical routes and sensitive healthcare workflows by implementing dynamic JSON Web Tokens (JWT), robust HTTPS protocol enforcement, and precise multi-tier Role-Based Access Control (RBAC).
- Solved a major structural scheduling bottleneck by engineering server-side sorting logic capable of generating and processing highly complex monthly multi-shift (Morning/Night) rotational data matrixes.

Kitchen Display Screen (KDS) & Order Processing Engine

Technologies: C#, WPF, Relational Database Design, Hybrid Storage (Local SQL & Azure)

- Developed the relational backend schemas to orchestrate dynamic data-sharing workflows between physical POS points and internal kitchen queues.
- Built a synchronization service optimizing operational data streams using a hybrid infrastructure consisting of local SQL databases for low-latency writes and Azure cloud sync.

EDUCATION

Bachelor of Science in Computer Science Expected Graduation: 2027
University of Dhi Qar — Nasiriyah, Iraq (Currently in 3rd Year)

CERTIFICATIONS & TRAINING

Software Development & Architecture Track: Completed 24 rigorous courses focusing on foundational computer science, data structures, and enterprise architecture principles (ProgrammingAdvices.com).

Cisco Technical Certification: Networking Fundamentals and Cybersecurity Infrastructures.
